

1: INTRODUCTION

The rapid growth of information technology has significantly transformed the way businesses operate and communicate with their customers. In the modern digital world, businesses rely heavily on online platforms to promote their services, connect with customers, and expand their reach. Traditional business promotion methods such as printed advertisements, physical directories, and manual recruitment processes are no longer sufficient to meet the demands of today's competitive environment.

The **Business Accelerator** project is developed as a web-based platform designed to help businesses establish a strong digital presence and improve interaction with users. The platform allows businesses to create detailed profiles, post updates, showcase their services through galleries, and recruit potential employees through an integrated job portal. By combining these functionalities into a single system, the platform simplifies business management and improves communication between businesses and users.

The system is built using the **Django web framework**, which is based on the **Python programming language** and follows the **Model-View-Template (MVT) architecture**. Django provides a structured approach for web development, enabling developers to separate database logic, application logic, and user interface components. This architecture improves system maintainability, scalability, and security.

The Business Accelerator platform also allows standard users to explore businesses based on categories and locations, view business profiles, interact with posts through likes and comments, and provide reviews or ratings. Additionally, users can

search for job opportunities posted by businesses and apply for those jobs by uploading their resumes and cover letters. This feature makes the platform useful not only for businesses but also for job seekers.

The system integrates several important functionalities such as business profile management, user engagement features, business gallery management, job posting systems, and job application tracking. These features help businesses promote their services effectively while providing users with valuable information about businesses and employment opportunities.

By using modern web technologies such as **HTML, CSS, JavaScript, Django Template Engine, and SQLite database**, the Business Accelerator platform provides a responsive, secure, and efficient environment for both businesses and users. The system ensures organized data management, fast information retrieval, and smooth interaction between different components of the platform.

❖ **Key Points of the System**

- Provides a centralized platform for businesses and users
- Provides business galleries for showcasing services or products
- Allows users to like, comment, and interact with business posts
- Provides a rating and review system for businesses
- Includes a job portal where businesses can post job opportunities
- Allows users to apply for jobs by submitting resumes and cover letters
- Provides application management for business owners to review candidat

2: OBJECTIVE OF PROJECT

The main objective of the **Business Accelerator** project is to develop a comprehensive web-based platform that helps businesses promote their services, interact with users, and manage recruitment activities efficiently. In today's competitive digital environment, businesses require platforms that allow them to reach a wider audience while also providing users with convenient access to business information and job opportunities.

The Business Accelerator platform aims to create a centralized system where business owners and users can interact through a structured and organized interface. Business owners can create and manage their business profiles, share updates, upload galleries, and post job openings. At the same time, users can search for businesses, explore business profiles, interact with posts, provide feedback through reviews, and apply for job opportunities.

The project also focuses on improving the recruitment process by providing an integrated job portal. Businesses can post job vacancies and review applications submitted by users, while users can easily apply for jobs by uploading their resumes and cover letters. This feature reduces the complexity of traditional recruitment processes and makes hiring more efficient.

The system is designed using the **Django framework** with **Python**, which ensures a secure and scalable development environment. The platform also uses **HTML, CSS, and JavaScript** to create an interactive user interface, while **SQLite** is used as the database for storing and managing system data. The use of modern web technologies ensures that the platform performs efficiently and provides a smooth user experience.

❖ **Key Objectives of the System**

- To develop a centralized web platform that connects businesses and users.
- To allow businesses to create and manage detailed business profiles.
- To provide businesses with the ability to share posts, updates, and announcements.
- To allow users to search and explore businesses based on categories and locations.
- To enable interaction between businesses and users through likes, comments, and reviews.
- To create a job portal where businesses can post job opportunities.
- To allow users to apply for jobs by submitting resumes and cover letters.
- To provide businesses with tools to review and manage job applications.
- To maintain structured and organized data using a relational database system.
- To develop a secure authentication system for user registration and login.
- To create a scalable platform that can be expanded with additional features in the future.

3: ENVIRONMENT DESCRIPTION

The **Business Accelerator** system is developed as a web-based application using modern web technologies and development tools. The development environment consists of both hardware and software components that are required for building, testing, and running the system efficiently. This environment ensures that the platform operates smoothly while supporting the development of scalable and secure features.

The system is implemented using the **Django web framework**, which is built on the **Python programming language**. Django provides a structured framework for developing web applications and follows the **Model-View-Template (MVT)** architecture. This architecture separates application logic, data management, and user interface design, which improves maintainability and scalability.

The frontend of the system is developed using **HTML, CSS, and JavaScript**, which are responsible for designing the layout, styling the interface, and providing interactive functionality. The **Django Template Engine** is used to dynamically display content retrieved from the database.

The application stores and manages data using **SQLite3**, which is a lightweight relational database system. SQLite is suitable for small to medium-sized web applications and allows efficient storage of data such as user accounts, business profiles, posts, comments, reviews, and job applications.

Development and testing of the application are performed using modern development tools such as **Visual Studio Code** and web browsers. These tools help developers write code, test system functionality, and debug errors during development.

❖ **Hardware Requirements :**

- Processor: Intel Core i3 or higher
- RAM: Minimum 4 GB
- Storage: Minimum 500 GB hard disk
- Internet connection for accessing the web application

❖ **Software Requirements :**

- Operating System: Windows
- Programming Language: Python
- Web Framework: Django
- Frontend Technologies: HTML, CSS, JavaScript
- Database Management System: SQLite3
- Database Management System: SQLite3

❖ **Technologies Used in the Project :**

- **Python:**Used for implementing backend logic and server-side programming.
- **Django Framework:** Handles routing, authentication, database interaction, and application logic.
- **HTML:** Provides the structure of web pages.
- **CSS:** Used to design the layout and appearance of the user interface.
- **JavaScript:** Adds interactivity to web pages such as dynamic actions and user interactions.
- **Django Template Engine:** Used to dynamically render data from the backend into HTML pages.
- **SQLite3 Database:** Stores and manages system data including users, businesses, posts, comments, and job applications.

❖ **DEVELOPMENT TOOLS :**

- **Visual Studio Code**: Used as the primary code editor for writing and managing project files.
- **Django Development Server**: Used to run and test the web application during development.
- **Web Browser**: Used for testing and viewing the application interface.

4: ANALYSIS REPORT

The **Analysis phase** is one of the most important stages in the software development process. During this phase, the requirements of the system are carefully studied and analyzed in order to understand how the proposed system should function. The purpose of system analysis is to identify user needs, define system functionalities, and design a structured approach for building the system.

For the **Business Accelerator** platform, the analysis phase focuses on understanding how businesses and users will interact within the system. It involves identifying the required features such as business profile management, user interaction through posts and reviews, and the job portal system that allows users to apply for jobs posted by businesses.

The analysis process also includes studying how data will be stored, managed, and retrieved within the system. Since the system involves multiple entities such as users, businesses, posts, comments, reviews, and job applications, it is important to define a proper database structure that maintains relationships between these entities.

Another important part of the analysis phase is identifying system requirements and determining how the proposed system will improve upon existing solutions. The Business Accelerator system aims to provide a centralized platform where businesses can promote their services and manage recruitment while users can explore businesses and apply for job opportunities.

The analysis phase ensures that the system is designed according to user needs and technical feasibility. It provides a clear understanding of system functionality, which helps developers design and implement the system effectively.

4.1 REQUIREMENT SPECIFICATION

Requirement specification is an important stage in system analysis where the needs and expectations of users are clearly defined. It identifies what the system should do and the features that must be included to meet user requirements. For the **Business Accelerator** platform, requirement specification focuses on defining the system functionality for both standard users and business owners.

The requirement specification helps developers understand the operations that the system must perform and ensures that the final system fulfills the needs of users effectively. It also helps in designing the system structure and database relationships properly.

The requirements of the Business Accelerator system can be categorized into **Functional Requirements** and **Non-Functional Requirements**.

1. Functional Requirements:

Functional requirements describe the specific features and operations that the system must perform. These requirements define how users interact with the platform and how the system processes different tasks.

❖ **User Registration and Authentication :**

The system must allow new users to register and create accounts. This feature enables users to access the platform and interact with businesses.

- Users must be able to register by providing details such as name, email, password, gender, date of birth, and city.
- The system must store user information securely in the database.
- Registered users must be able to log in using their email and password.

- The system must verify user credentials during login.
- Users should be able to update their profile information.

❖ **Business Profile Management**

Business owners must be able to create and manage business profiles within the platform. This feature allows businesses to showcase their services and provide detailed information.

- Business owners must be able to add a new business profile.
- Business profiles should contain details such as business title, description, address, contact information, and website URL.
- Business owners must be able to update or edit business information.
- Each business profile should be associated with a category and location.

❖ **Business Post Management**

The system should allow businesses to share updates or announcements through posts.

- Businesses should be able to create posts with title, description, and thumbnail image.
- Users should be able to view posts published by businesses.
- Posts should appear on the business profile page.
- Businesses should be able to manage or update their posts.

❖ **User Interaction Features**

The platform must provide interaction features that allow users to engage with business content.

- Users should be able to like business posts.
- Users should be able to comment on posts.

- Users should be able to like comments posted by other users.
- The system should display total likes and comments for each post.

❖ **Business Review and Rating System**

The system should provide a review system where users can share feedback about businesses.

- Users should be able to rate businesses using a rating system.
- Users should be able to write textual reviews.
- Reviews should be displayed on the business detail page.
- Businesses should be able to view feedback provided by users.

❖ **Business Gallery Management**

The platform should allow businesses to showcase their products or services through image galleries.

- Business owners should be able to upload multiple images.
- Images should be displayed in the business gallery section.
- Users should be able to view gallery images of each business.

❖ **Job Posting System**

The system must allow businesses to create job opportunities for users.

- Businesses should be able to create job postings.
- Job postings must include job title, job type, salary, location, requirements, and deadline.
- Job listings should be visible to all users.

❖ **Job Application Management**

The system must allow users to apply for jobs posted by businesses.

- Users should be able to apply for jobs using the platform.
- Users must upload their resume and cover letter.
- The system should store job applications in the database.
- Business owners should be able to view job applications.
- Businesses should be able to accept or reject applicants.

2. Non-Functional Requirements:

Non-functional requirements describe the quality attributes of the system and how well it performs.

❖ **Performance**

- The system should respond quickly to user requests.
- Database queries should be optimized for fast data retrieval.

❖ **Security**

- The system must ensure secure authentication.
- Passwords must be stored securely.
- Unauthorized access to system data should be prevented.

❖ **Usability**

- The platform must provide a simple and user-friendly interface.
- Navigation should be clear and easy to use.

❖ **Reliability**

- The system should operate consistently without frequent failures.
- Stored data must remain accurate and reliable.

❖ **Scalability**

- The system should allow future feature expansion.
- Additional modules such as messaging systems or mobile applications can be integrated.

4.2 PROPOSED SYSTEM WITH ITS ADVANTAGES

The **Proposed System** describes the improved solution developed to overcome the limitations of traditional systems. The **Business Accelerator** platform is designed as a centralized web application where businesses and users can interact efficiently. The system integrates business promotion, user interaction, and job recruitment into a single platform.

In the proposed system, users can register on the platform and create their personal profiles. After logging in, users can explore various businesses, view detailed business profiles, interact with posts through likes and comments, and provide reviews or ratings. Additionally, users can browse job opportunities posted by businesses and apply directly through the platform by uploading their resumes and cover letters.

Business owners are provided with special features that allow them to manage their businesses effectively. They can create and update business profiles, upload gallery images, publish posts or updates, and post job openings. Business owners

can also review job applications submitted by users and update the status of each application.

The system uses **Django framework with Python** for backend development and **HTML, CSS, and JavaScript** for frontend design. The **SQLite relational database** stores all information related to users, businesses, posts, reviews, and job applications.

The proposed system ensures better data organization, efficient communication between businesses and users, and simplified recruitment processes.

❖ Working of the Proposed System

The Business Accelerator system works through a sequence of interactions between users, businesses, and the platform.

First, users register and log into the system. After authentication, users can browse businesses based on categories and locations. They can view business details, posts, and gallery images.

Users can interact with business content by liking posts, commenting, and writing reviews. These interactions help businesses understand user feedback and improve their services.

Businesses can also post job openings on the platform. Users can apply for these jobs by uploading their resumes and cover letters. The job applications are stored in the database and can be reviewed by business owners.

Business owners can analyze applications and update their status to accepted, rejected, or pending. This process simplifies recruitment and helps businesses manage job applications efficiently.

❖ Advantages of the Proposed System

The Business Accelerator platform provides several advantages compared to traditional systems.

- Provides a centralized platform for business promotion and recruitment.
- Allows businesses to create detailed business profiles and share updates.
- Improves interaction between businesses and users through likes, comments, and reviews.
- Simplifies the job recruitment process for businesses.
- Allows users to search for businesses and job opportunities easily.
- Provides organized data storage using a relational database.
- Enhances communication between businesses and potential customers.
- Reduces manual processes involved in recruitment.
- Supports future system expansion and integration of additional features.

4.3 DATABASE DESCRIPTION

The Business Accelerator system uses a **relational database structure** implemented using **SQLite3**. The database stores information related to users, businesses, posts, reviews, jobs, and applications. Each table is designed to store a specific type of information and maintain relationships using **primary keys and foreign keys**. Below are the database tables used in the system.

1. **tblState**

Field Name	Data Type	Key	Description
stateId	AutoField	Primary Key	Unique identifier for each state
stateName	TextField	-	Name of the state

2. tblCity

Field Name	Data Type	Key	Description
cityId	AutoField	Primary Key	Unique identifier for city
cityName	TextField	-	Name of the city
stateId	AutoField	Foreign Key	References tblState

3. tblCategories

Field Name	Data Type	Key	Description
categoryId	AutoField	Primary Key	Unique identifier for category
categoryName	TextField	-	Name of the business category

4. tblUser

Field Name	Data Type	Key	Description
userId	AutoField	Primary Key	Unique identifier for user
userName	TextField	-	Name of the user
password	TextField	-	Password of the user
email	TextField	-	Email address
profilePic	ImageField	-	Profile picture
gender	TextField	-	Gender of the user
dob	DateField	-	Date of birth
cityId		ForeignKey	References tblCity

5. tblBusiness

Field Name	Data Type	Key	Description
bussId	AutoField	Primary Key	Unique business identifier
title	TextField	-	Business name
description	TextField	-	Description of business
cityId	ForeignKey	Foreign Key	References tblCity
userId	ForeignKey	Foreign Key	Owner of the business
coverImg	ImageField	-	Business cover image
categoryId	ForeignKey	Foreign Key	References tblCategories
addedDT	DateTimeField	-	Date business added
inseptionDT	DateTimeField	-	Business creation date
bussContact	TextField	-	Contact number
bussEmail	TextField	-	Business email
bussAddress	TextField	-	Business address
bussWebsite	TextField	-	Business website

6. tblBussImages

Field Name	Data Type	Key	Description
bussImageId	AutoField	Primary Key	Image identifier
bussId	ForeignKey	Foreign Key	References tblBusiness
imageURL	TextField	-	URL/path of image

7. tblBussPost

Field Name	Data Type	Key	Description
bussPostId	AutoField	Primary Key	Unique post ID
bussId	ForeignKey	Foreign Key	Business that created post
title	TextField	-	Post title
desc	TextField	-	Post description
thumbnail	ImageField	-	Post thumbnail
createdDT	DateTimeField	-	Post creation date

8. tblPostLike

Field Name	Data Type	Key	Description
likeId	AutoField	Primary Key	Like identifier
postId	ForeignKey	Foreign Key	References tblBussPost
userId	ForeignKey	ForeignKey	User who liked
likedDT	DateTimeField	-	Date of like

9. tblPostComment

Field Name	Data Type	Key	Description
commentId	AutoField	Primary Key	Comment identifier
postId	ForeignKey	ForeignKey	References tblBussPost
userId	ForeignKey	ForeignKey	User who commented
comment	TextField	-	Comment text
commentDT	DateTimeField	-	Comment date

10. tblCommentLike

Field Name	Data Type	Key	Description
commentLikeId	AutoField	Primary Key	Comment like ID
commentId	ForeignKey	Foreign Key	References tblPostComment
userId	ForeignKey	ForeignKey	User who liked comment
likedDT	DateTimeField	-	Date of like

11. tblReview

Field Name	Data Type	Key	Description
reviewId	AutoField	Primary Key	Review identifier
bussId	ForeignKey	Foreign Key	Business being reviewed
userId	ForeignKey	Foreign Key	User who wrote review
ratings	IntegerField	-	Rating given by user
review	TextField	-	Review text
reviewDT	DateTimeField	-	Date of review

12. tblBussGallery

Field Name	Data Type	Key	Description
galleryId	AutoField	Primary Key	Gallery ID
bussId	ForeignKey	Foreign Key	References tblBusiness
image	ImageField	-	Gallery image
caption	TextField	-	Image caption
uploadedDT	DateTimeField	-	Upload date

13. tblJob

Field Name	Data Type	Key	Description
jobId	AutoField	Primary Key	Job identifier
bussId	ForeignKey	Foreign Key	Business posting job
title	TextField	-	Job title
description	TextField	-	Job description
jobType	TextField	-	Job type
salary	TextField	-	Salary offered
location	TextField	-	Job location
requirements	TextField	-	Job requirements
isActive	BooleanField	-	Job active status
postedDT	DateTimeField	-	Job posted date
deadline	DateField	-	Application deadline

14. tblJobApplication

Field Name	Data Type	Key	Description
applicationId	AutoField	Primary Key	Application ID
jobId	ForeignKey	Foreign Key	Job applied for
userId	ForeignKey	Foreign Key	Applicant user
coverLetter	TextField	-	Cover letter
resume	FileField	-	Uploaded resume
status	TextField	-	Application status
appliedDT	DateTimeField	-	Application date

5: DESIGN REPORT

The **Design Report** describes the structural and visual design of the Business Accelerator system. After the system requirements were analyzed in the previous phase, the design phase focuses on defining how the system will be implemented and how different components of the system will interact with each other.

The purpose of system design is to convert system requirements into a structured solution that developers can implement effectively. It provides a blueprint for the system architecture, database structure, user interface, and data flow within the system.

The Business Accelerator platform is designed using the **Model-View-Template (MVT) architecture of Django**, which separates the application logic, user interface, and data management. This separation improves maintainability, scalability, and code organization.

The design phase also defines how users interact with the system through different interfaces such as registration forms, business profile pages, job listings, and application management dashboards.

The design of the system ensures that:

- The platform is **user-friendly and easy to navigate**
- Business owners can manage their business profiles and job postings efficiently
- Users can **interact with businesses through posts, reviews, and job applications**
- Data is stored and retrieved efficiently from the database

The design of the Business Accelerator system is divided into the following sections:

- 1. Site Diagram – Shows the structure and navigation flow of the system**
- 2. Input Screen Layouts – Displays the forms used for data entry**
- 3. Output Reports – Displays the information generated by the system**

5.1 Site Diagram

The Site Diagram represents the overall navigation structure of the Business Accelerator platform. It illustrates how different pages of the system are connected and how users move between them.

The site diagram helps developers and designers understand the flow of the application and how different modules interact with each other.

The Business Accelerator platform contains several modules that allow users and business owners to interact with the system efficiently.

Main Modules of the System

- Home Page
- User Authentication Module
- Business Management Module
- Business Search Module
- Business Post Interaction Module
- Review and Rating Module
- Job Portal Module
- Job Application Management Module

These modules are interconnected and provide a complete business networking platform.

Site Navigation Structure

The navigation structure of the system includes the following pages:

Home Page

- Displays platform introduction
- Shows featured businesses
- Displays recent business posts
- Provides search functionality

User Authentication Pages

- User Registration Page
- User Login Page
- User Profile Page

These pages allow users to create accounts and access system features.

Business Management Pages

- Add Business Page
- Edit Business Page
- Business Dashboard
- Business Gallery Management

These pages allow business owners to manage their business information and images.

Business Interaction Pages

- Business Detail Page
- Business Post Page
- Post Comment Section
- Post Like Feature

These pages allow users to interact with businesses.

Job Portal Pages

- Job Listing Page
- Job Detail Page
- Apply for Job Page

These pages allow users to explore and apply for job opportunities.

Application Management Pages

- Manage Applicants Page (Business Owner)
- My Applications Page (User)

These pages help track job application status.

5.2 INPUT SCREEN LAYOUTS

Each input screen represents the interface through which users enter data into the system. These screens are designed to be user-friendly, simple, and efficient.

1. User Registration Screen

Description

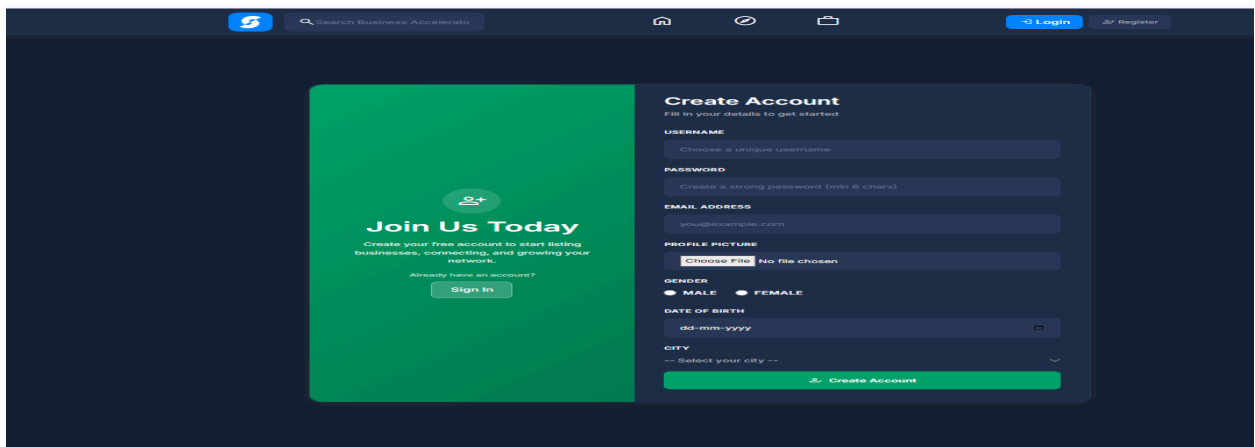

The User Registration screen allows new users to create an account on the platform by providing their personal details.

Input Fields

- User Name
- Email
- Password
- Gender
- Date of Birth
- City Selection
- Profile Picture Upload

Functionality

- Validates user input
- Stores user data in database
- Redirects user to login page after successful registration

The screenshot displays a user registration interface on a dark-themed website. On the left, a green card with a person icon and the text "Join Us Today" encourages users to create a free account. On the right, a "Create Account" form is visible, featuring input fields for Username, Password, Email Address, Profile Picture, Gender (Male/Female), Date of Birth, and City. A "Create Account" button is at the bottom of the form. The top navigation bar includes a search bar, home, and profile icons, along with "Login" and "Register" links.

2. User Login Screen

Description

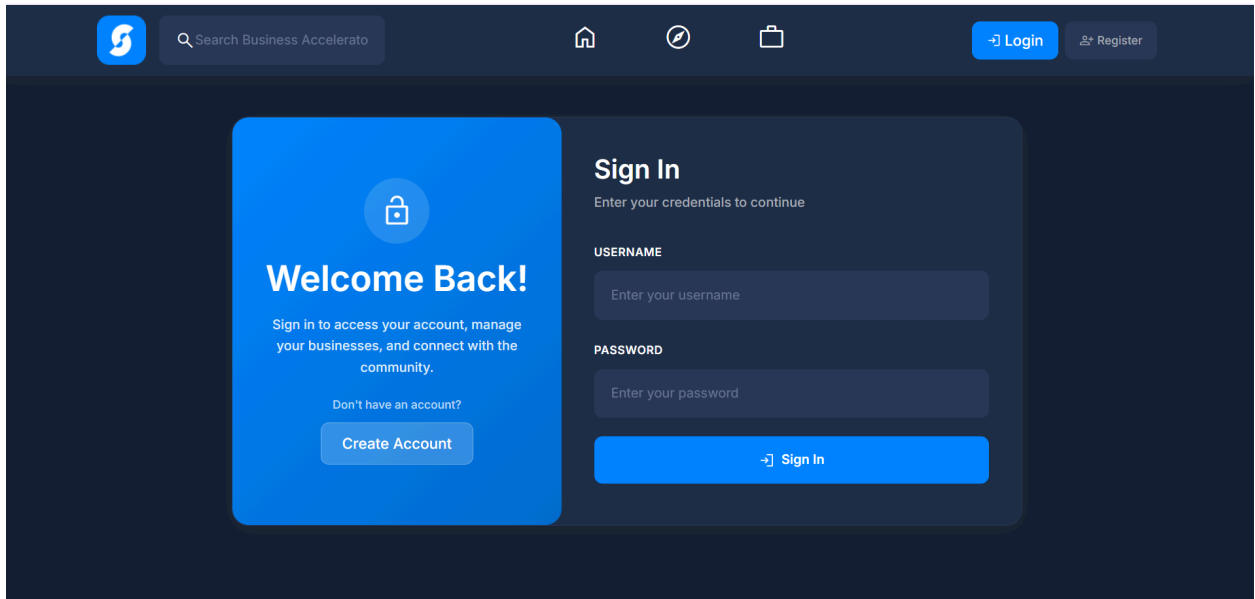

This screen allows registered users to log into the system using their credentials.

Input Fields

- Email
- Password

Functionality

- Authenticates user
- Redirects to dashboard

The image shows a user login screen for a 'Business Accelerator' platform. The interface is dark-themed with blue accents. At the top, there is a navigation bar with a logo, a search bar labeled 'Search Business Accelerato', and icons for home, a document, and a shopping bag. On the right side of the navigation bar are 'Login' and 'Register' buttons. The main content area is split into two sections. On the left, a blue box contains a lock icon, the text 'Welcome Back!', a description of the platform's benefits, a link to 'Don't have an account?', and a 'Create Account' button. On the right, a dark box titled 'Sign In' prompts the user to 'Enter your credentials to continue'. It features input fields for 'USERNAME' (with placeholder 'Enter your username') and 'PASSWORD' (with placeholder 'Enter your password'), followed by a blue 'Sign In' button.

3. Add Business Screen

Description

This screen allows business owners to add their business details to the platform.

Input Fields

- Business Title
- Description
- Category
- City
- Contact Number
- Email
- Address
- Website
- Cover Image Upload

Functionality

- Stores business details
- Links business to user

The screenshot displays a web application interface with a dark blue theme. On the left, a purple sidebar contains the text 'List Your Business' and a button labeled 'My Business'. The main content area features a 'Register Business' form. The form includes the following fields: 'BUSINESS TITLE' (with a placeholder 'e.g. 'Bakery 1234, Inc.'), 'BUSINESS EMAIL' (with a placeholder 'example@bakery.com'), 'DESCRIPTION' (with a placeholder 'Describe your business in detail...'), 'CITY' (a dropdown menu showing 'Select City'), 'CATEGORY' (a dropdown menu showing 'Select Category'), 'CONTACT NUMBER' (with a placeholder '904234 567890'), 'BUSINESS ADDRESS' (with a placeholder '123 Main Street, New York'), 'BUSINESS WEBSITE (OPTIONAL)' (with a placeholder 'http://www.example.com'), and 'COVER IMAGE' (with buttons for 'Choose File' and 'No file chosen'). At the bottom of the form is a 'Register Business' button. The top navigation bar includes a search icon, a 'Search Business Accounts' input, and several utility icons.

4. Add Post Screen

Description

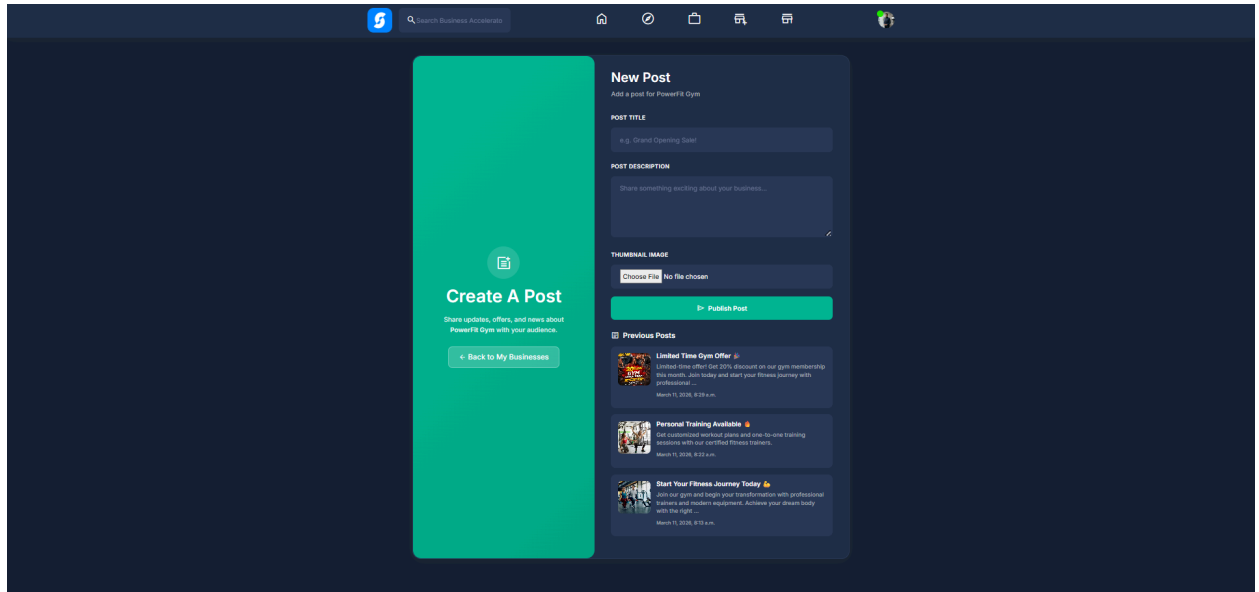

This screen allows businesses to create posts or updates.

Input Fields

- Title
- Description
- Thumbnail Image

Functionality

- Publishes post
- Displays on business profile

5. Job Posting Screen

Description

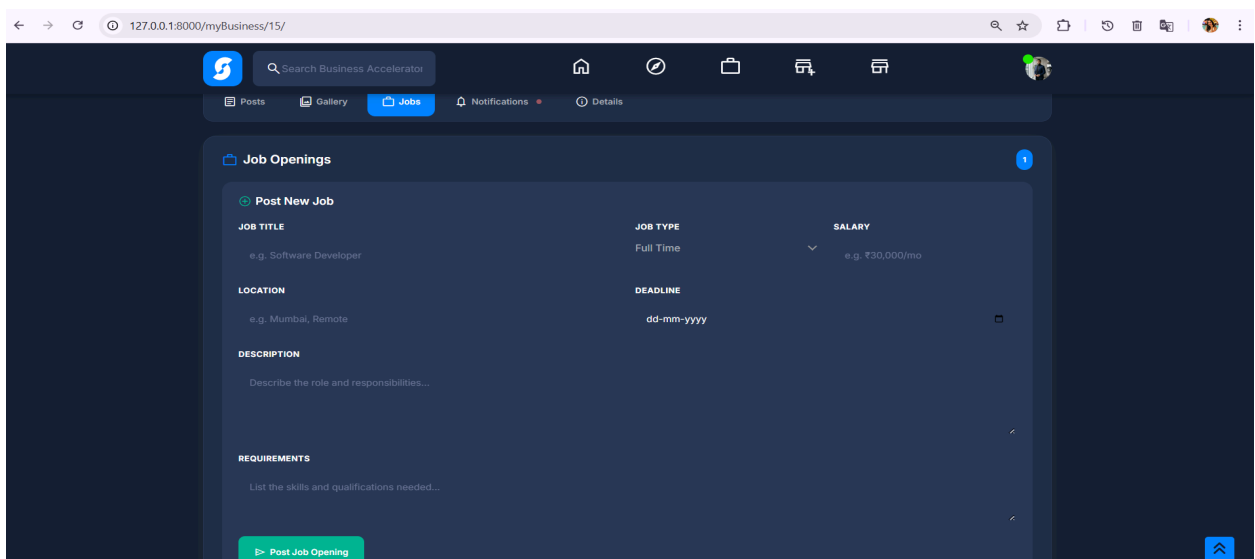

This screen allows businesses to post job opportunities.

Input Fields

- Job Title
- Description
- Job Type
- Salary
- Location
- Requirements
- Deadline

Functionality

- Stores job data
- Displays in job portal

The screenshot shows a web application interface for posting a new job. The browser address bar displays "127.0.0.1:8000/myBusiness/15/". The application has a dark theme with a top navigation bar containing a search bar labeled "Search Business Accelerator" and icons for home, settings, and other functions. Below the navigation bar, there are tabs for "Posts", "Gallery", "Jobs" (which is active), "Notifications", and "Details". The main content area is titled "Job Openings" and features a "Post New Job" button. Below this, there is a form with several input fields: "JOB TITLE" (with a placeholder "e.g. Software Developer"), "JOB TYPE" (with a dropdown menu showing "Full Time"), "SALARY" (with a placeholder "e.g. ₹30,000/mo"), "LOCATION" (with a placeholder "e.g. Mumbai, Remote"), "DEADLINE" (with a placeholder "dd-mm-yyyy"), "DESCRIPTION" (with a placeholder "Describe the role and responsibilities..."), and "REQUIREMENTS" (with a placeholder "List the skills and qualifications needed..."). At the bottom of the form, there is a green button labeled "Post Job Opening".

6. Job Application Screen

Description

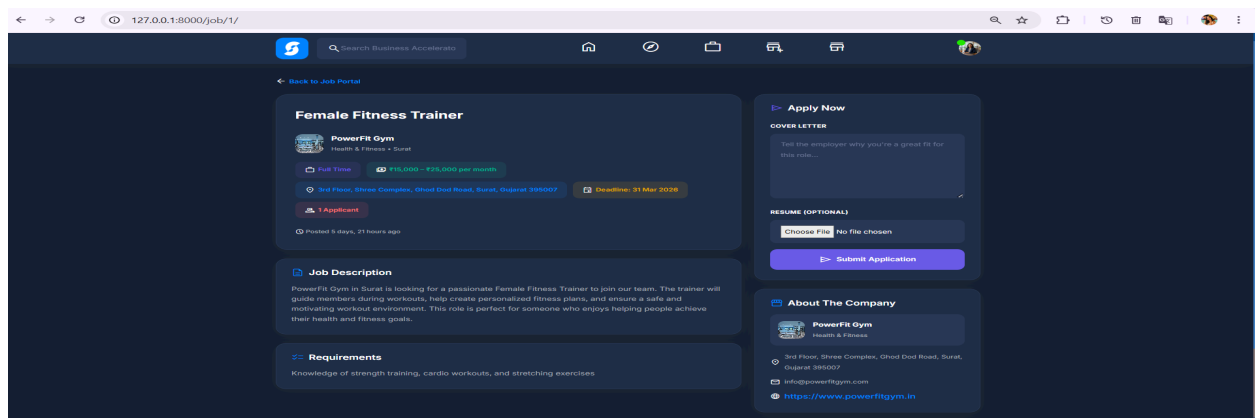

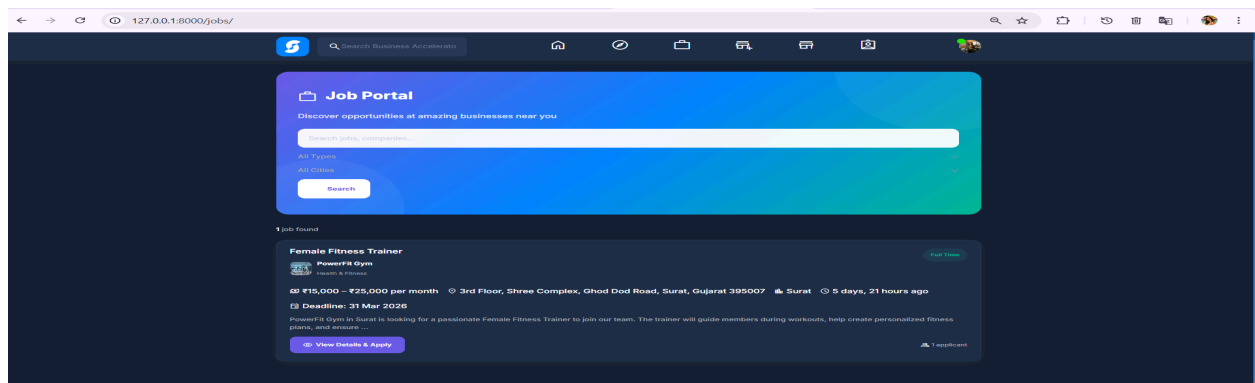

This screen allows users to apply for jobs.

Input Fields

- Cover Letter
- Resume Upload

Functionality

- Submits application
- Stores resume and details

7. Review Submission Screen

Description

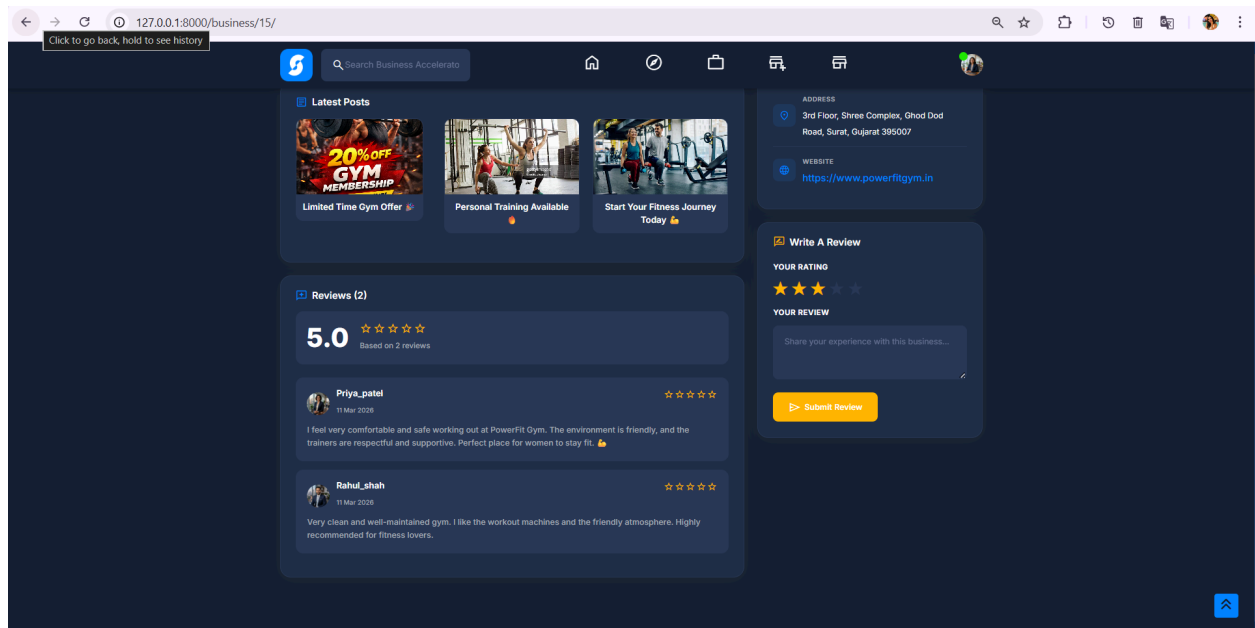

This screen allows users to submit ratings and reviews.

Input Fields

- Rating
- Review Text

Functionality

- Stores feedback
- Displays on business page

5.3 Output Reports

The Output Reports represent the information displayed by the system after processing user input. These outputs help users and business owners to view, analyze, and interact with the data stored in the system.

The output screens are designed to present information in a clear, structured, and user-friendly format. These reports include business details, posts, job listings, and application statuses.

1. Home Page Output

Description

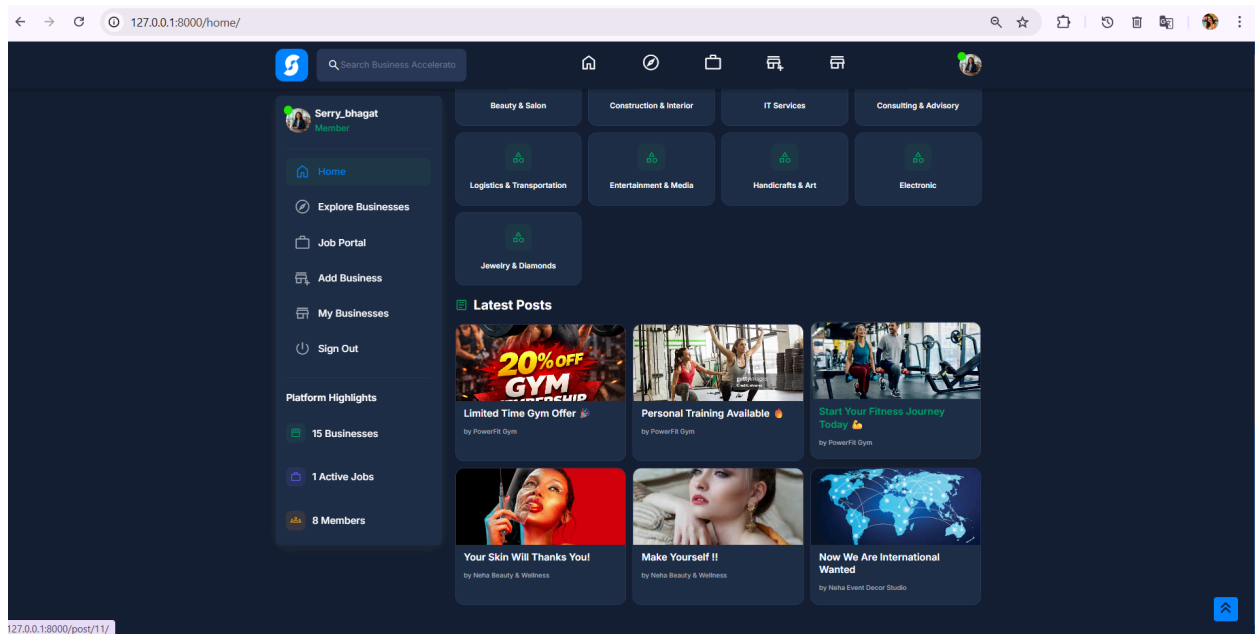

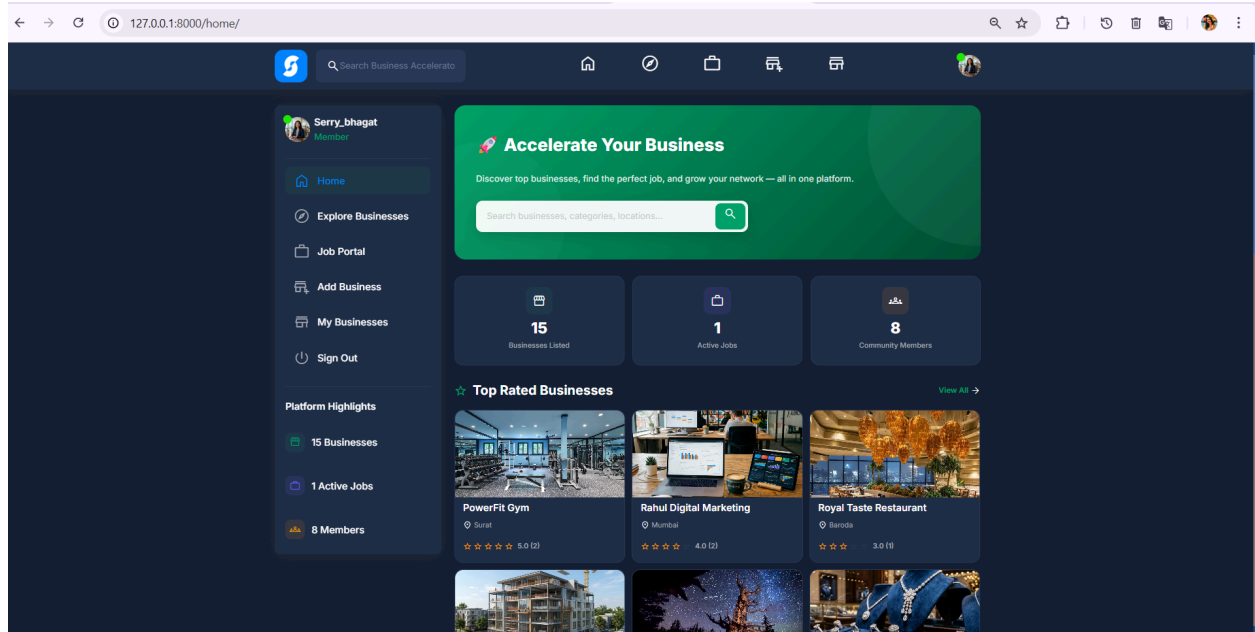

The Home Page is the main interface of the system that provides an overview of the platform.

Displayed Information

- Featured businesses
- Recent business posts
- Navigation menu
- Search bar

Purpose

- Provides entry point to the system
- Helps users explore platform content

2. Business Detail Page

Description

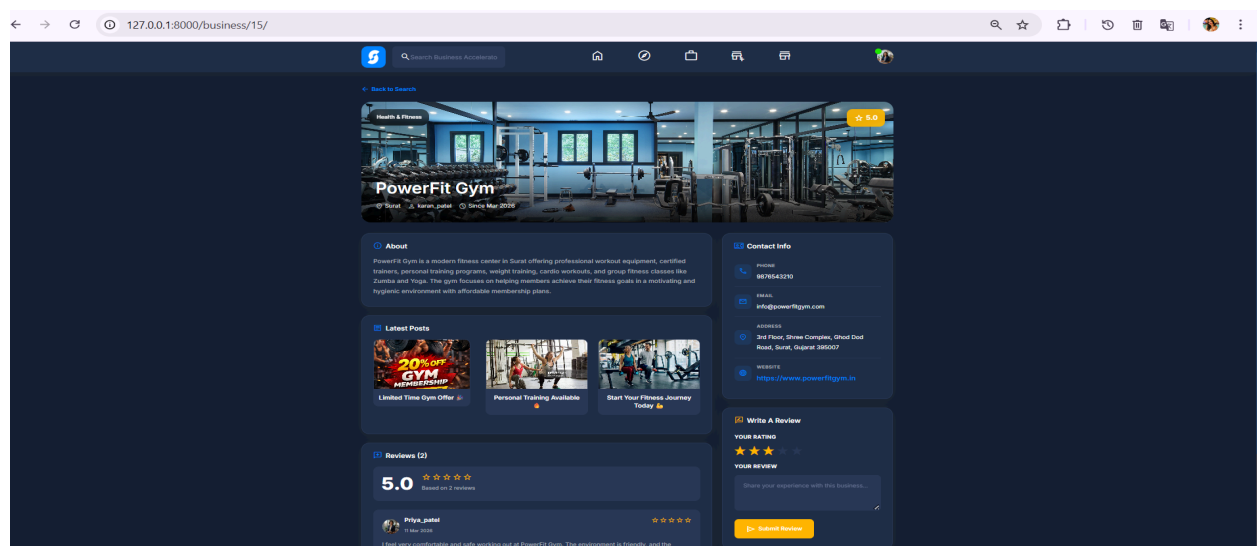

This page displays complete information about a selected business.

Displayed Information

- Business name and description
- Contact details and address
- Business category and location
- Business posts
- Image gallery
- Reviews and ratings
- Job listings

Purpose

- Provides detailed view of business
- Allows user interaction (review, like, comment)

3. Business Post Display

Description

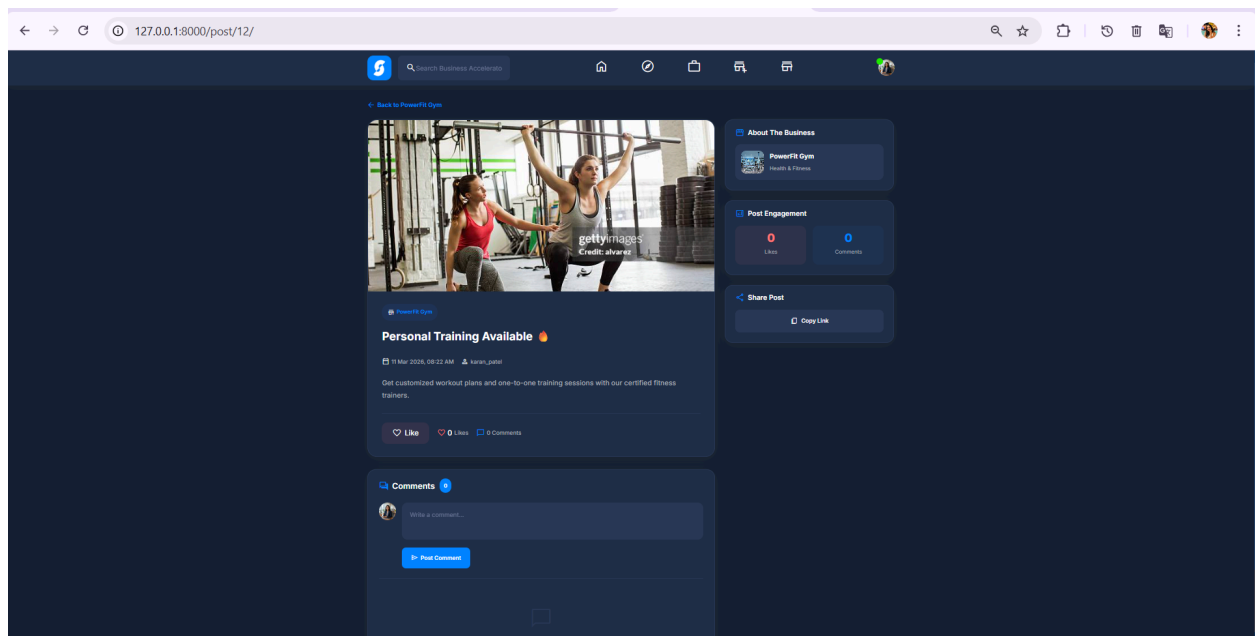

This screen displays posts created by businesses.

Displayed Information

- Post title and description
- Thumbnail image
- Likes count
- Comments section

Purpose

- Enables user engagement
- Allows users to like and comment

4. Job Listing Page

Description

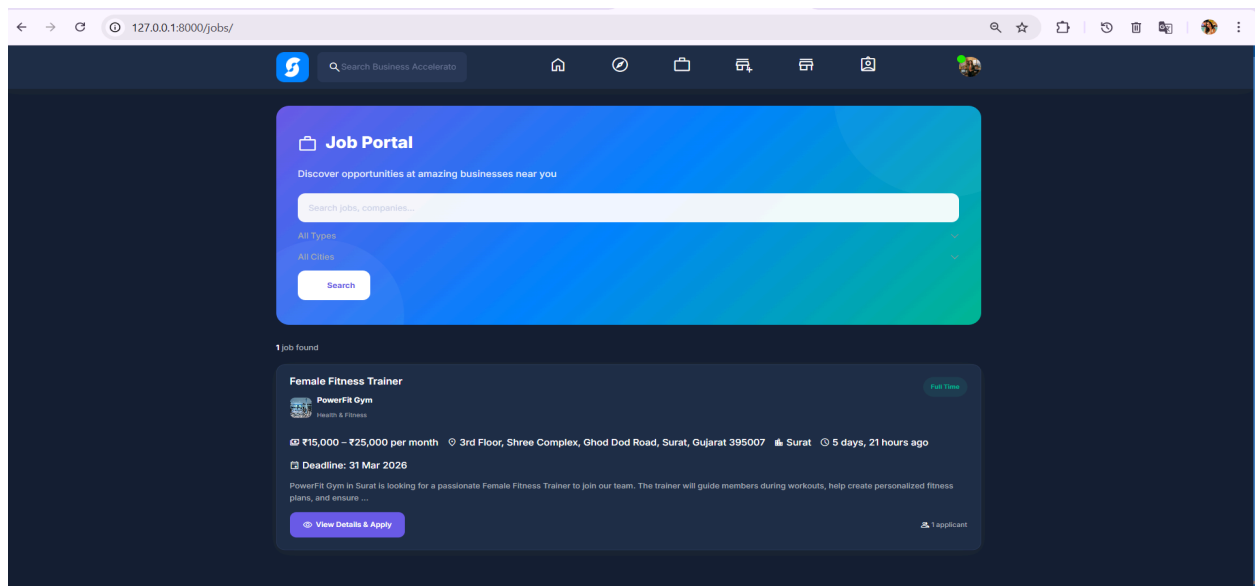

This page displays all available job opportunities.

Displayed Information

- Job title
- Company name
- Job type
- Salary
- Location
- Deadline

Purpose

- Helps users find jobs
- Provides filtering options

5. Job Application Status Page

Description

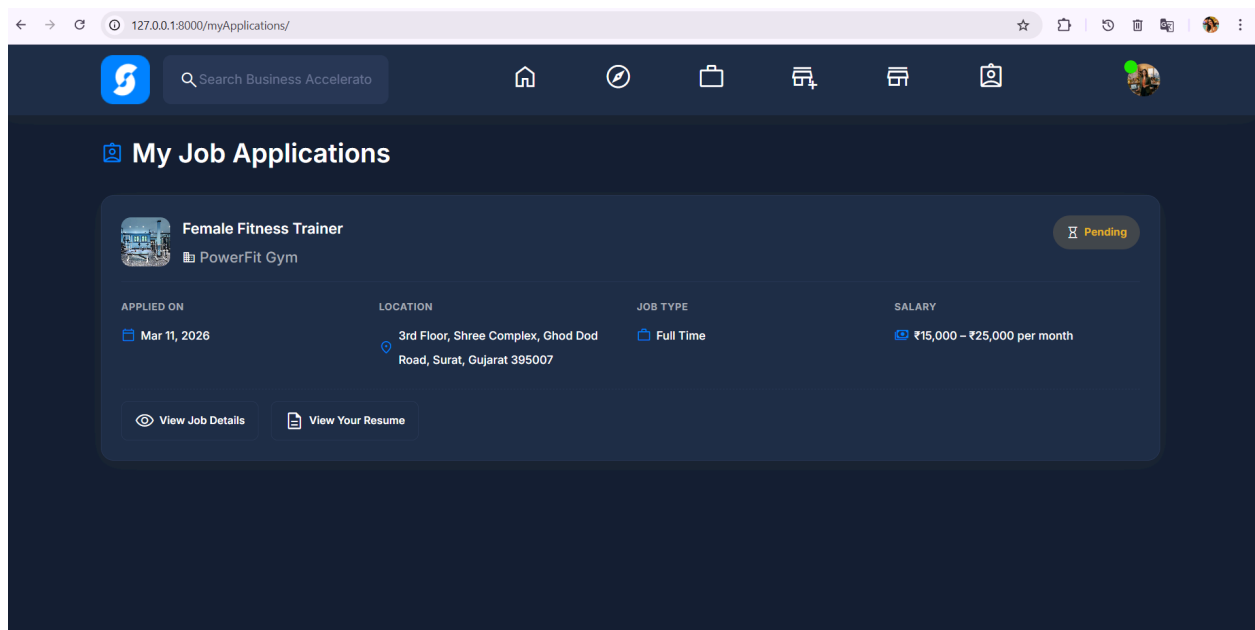

This page allows users to track their job applications.

Displayed Information

- Job title
- Business name
- Application date
- Application status (Pending, Reviewed, Accepted, Rejected)

Purpose

- Helps users track progress
- Improves transparency

6. Manage Applicants Page (Business Owner)

Description

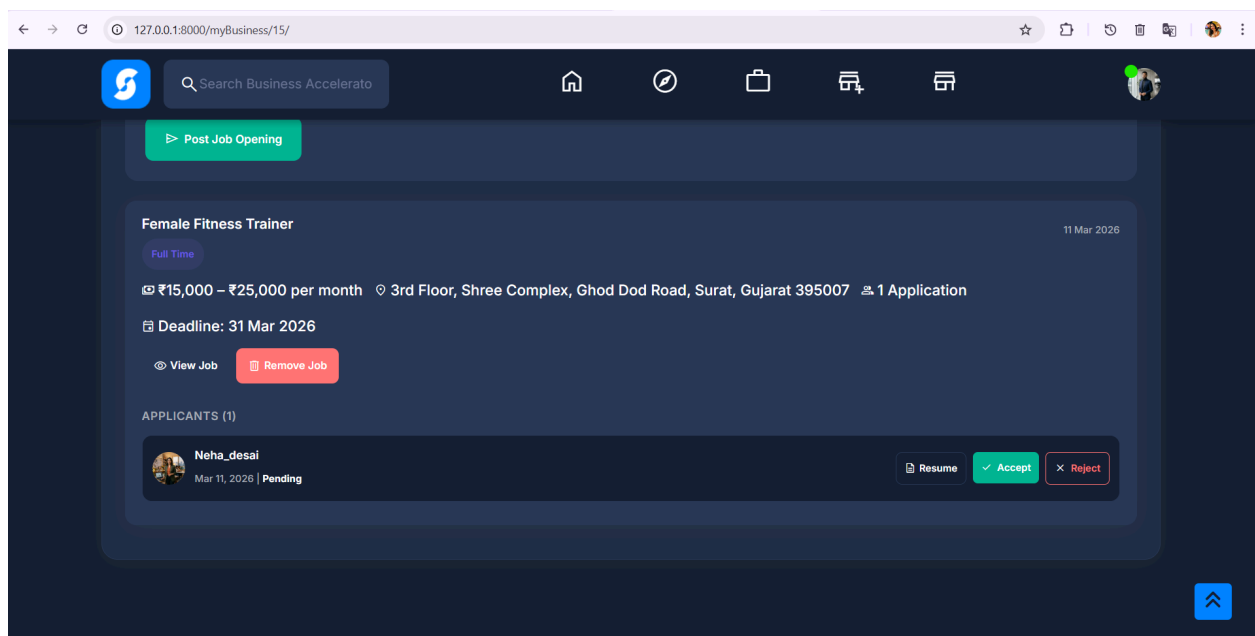

This page allows business owners to manage job applications.

Displayed Information

- Applicant name
- Resume download option
- Cover letter
- Application status

Purpose

- Helps businesses review candidates
- Allows accept/reject actions

7. Admin Dashboard

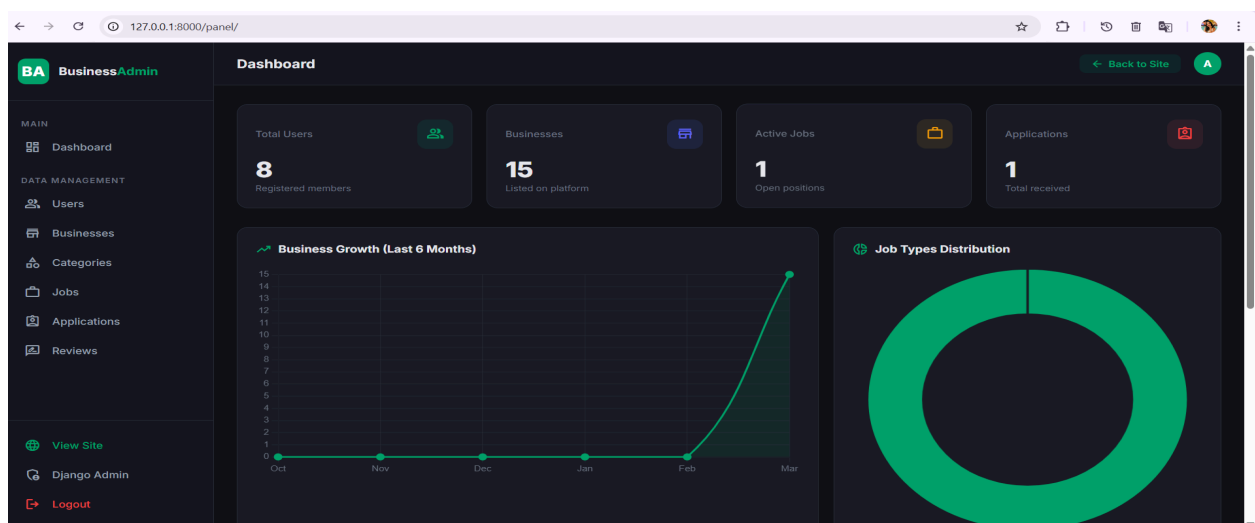

Description Central hub for administrators to view platform-wide statistics, trends, and recent activity.

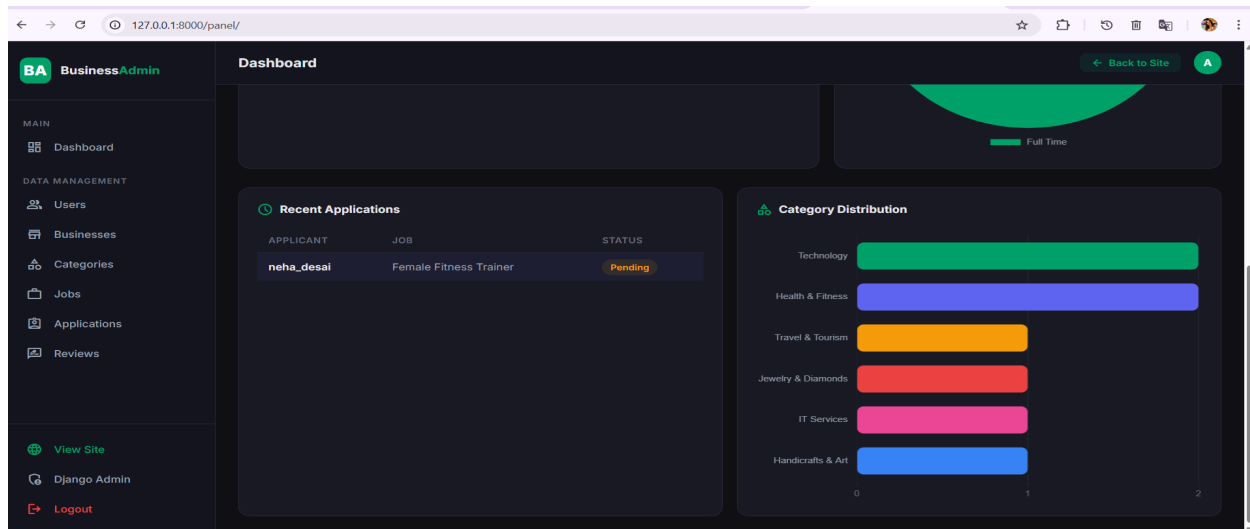

Displayed Information

- Total Stats: Counts for Users, Businesses, Jobs, and Applications.
- Activity Charts: Business growth trends and Job type distribution (Doughnut chart).
- Market Insights: Category distribution (Bar chart).
- Recent Activity: Quick view of the latest job applications and their status.

Purpose

- Provides a high-level overview of platform growth and engagement.
- Helps administrators monitor recruitment activity and business onboarding at a glance.

8. Manage Users Page (Admin)

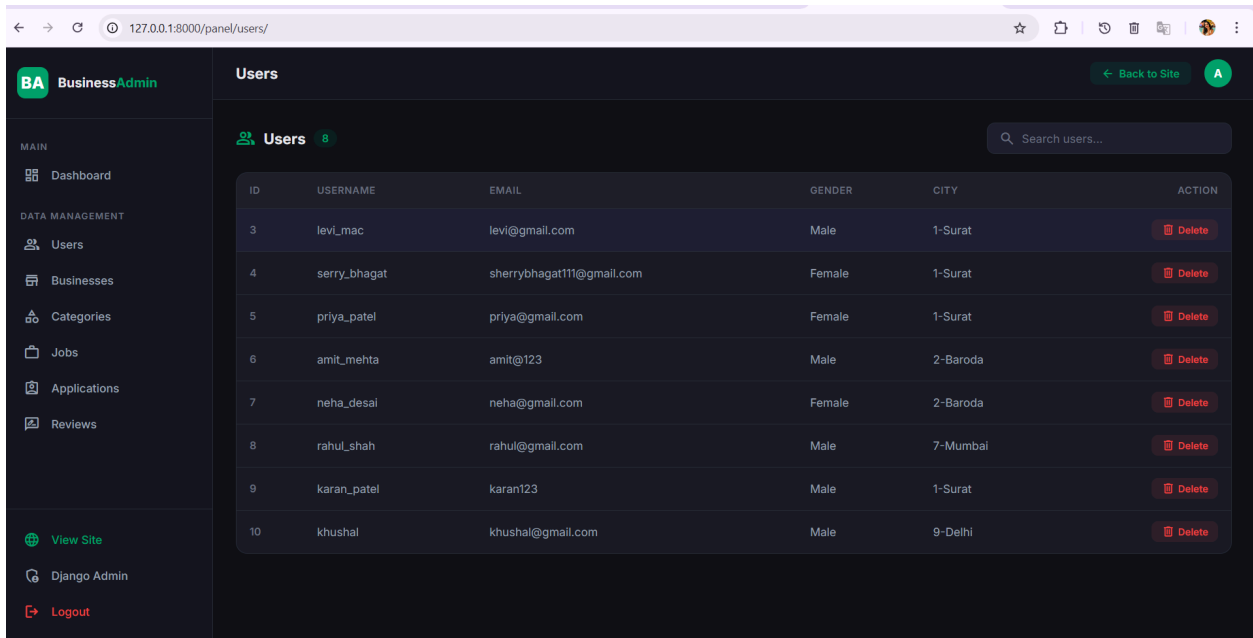

Description Interface for administrators to oversee and manage all registered user accounts.

Displayed Information

- User ID
- Username
- Email address
- Gender
- City of residence

Purpose

- Helps maintain user registry and data integrity.
- Allows for administrative removal of accounts if necessary.

9. Manage Businesses Page (Admin)

Description Allows administrators to monitor all business listings registered on the platform.

Displayed Information

- Business ID & Title
- Category (e.g., Finance, Tech, etc.)
- City location
- Business Owner (Link to User)
- Contact number

Purpose

- Ensures all business listings are categorized correctly.

- Provides administrative oversight over business entities.

6. TESTING REPORT

The **Testing Report** describes the process used to verify and validate the functionality of the Business Accelerator system. Testing ensures that the system works according to the specified requirements and is free from major errors or bugs.

The main objective of testing is to identify defects, ensure system reliability, and improve overall performance. Different types of testing such as functional testing, validation testing, and user testing are performed to ensure that each module of the system operates correctly.

The testing phase focuses on checking all major functionalities including user registration, business management, post interactions, and job application processes.

6.1 Test Case Design

Test Case Design involves creating structured test cases to verify whether different functionalities of the system are working as expected. Each test case includes input data, expected output, and actual result.

Below are some important test cases for the Business Accelerator system.

Test Case ID	Module	Test Description	Input	Expected Output	Result
TC01	User Registration	Register new user	Valid user data	User registered successfully	Pass
TC02	User Login	Login with correct credentials	Email & Password	Redirect to dashboard	Pass
TC03	User Login	Login with wrong password	Invalid password	Error message displayed	Pass
TC04	Add Business	Add new business	Valid business data	Business added successfully	Pass
TC05	Add Post	Create business post	Title, Description	Post displayed	Pass
TC06	Like Post	Like a post	Click like button	Like count increases	Pass
TC07	Comment Post	Add comment	Comment text	Comment displayed	Pass
TC08	Add Review	Submit review	Rating & text	Review stored and displayed	Pass
TC09	Job Posting	Add job	Job details	Job listed	Pass

TC10	Apply Job	Submit application	Resume & cover letter	Application submitted	Pass
TC11	View Applications	Check application status	User login	Status displayed	Pass
TC12	Manage Applicants	Accept/reject applicant	Change status	Status updated	Pass

Testing Approach

The following testing approaches were used:

- **Functional Testing** – Ensures each feature works correctly
- **Validation Testing** – Checks input validation and error handling
- **Database Testing** – Verifies correct data storage and retrieval
- **User Interface Testing** – Ensures proper display of UI elements

Testing Tools Used

- Django Development Server
- Web Browser (Chrome)
- SQLite3 Database Viewer

6.2 Testing Issues

During the testing phase, several issues were identified and resolved to improve system performance and reliability.

Common Issues Faced

- Incorrect form validation errors
- Image upload issues in business and gallery
- Duplicate likes/comments handling
- Login authentication errors
- File upload issues for resumes
- Data not displaying correctly in templates

Solutions Implemented

- Added proper form validation using Django forms
- Fixed media file handling using MEDIA_URL and MEDIA_ROOT
- Applied unique constraints to prevent duplicate likes
- Improved authentication logic
- Handled file uploads properly in forms and models
- Corrected template rendering using Django Template Engine

System Reliability

After resolving all issues:

- System performs efficiently
- All major functionalities work correctly
- User interaction is smooth and error-free

7. LIMITATION OF THE PROPOSED SYSTEM

The Business Accelerator system provides a comprehensive platform for businesses and users to interact; however, like any software system, it has certain limitations. These limitations are mainly due to time constraints, scope restrictions, and technological boundaries during development.

The following are the key limitations of the proposed system:

- The system currently uses **SQLite3**, which is suitable for small-scale applications but may not perform efficiently for large-scale data and high user traffic
- The platform does not include **real-time notifications**, so users are not instantly notified about likes, comments, or job application updates
- Limited **security features**, such as basic authentication without advanced encryption or multi-factor authentication
- The system is dependent on **internet connectivity**, and cannot function in offline mode
- File upload functionality (images and resumes) may have **size and format limitations**
- The system does not include **advanced search filters** for businesses and job listings
- There is no integration with **third-party services** such as payment gateways or social media platforms

- The user interface is basic and may not provide a fully optimized experience across all devices
- The system does not support **multi-language functionality**, limiting accessibility for users from different regions
- Performance may degrade if the number of users, businesses, and posts increases significantly

8. FUTURE ENHANCEMENT

The Business Accelerator system can be further improved by adding new features and enhancing existing functionalities. These enhancements will improve user experience, scalability, and system performance.

- **Follow / Following System**

Users will be able to follow businesses and receive updates about their posts and job openings. This will increase user engagement and create a personalized experience.

- **Real-Time Notifications**

The system can provide instant notifications for likes, comments, job updates, and application status, improving user interaction with the platform.

- **Advanced Search and Filters**

Users will be able to search businesses and jobs using filters like category, location, and ratings, making it easier to find relevant results.

- **Chat System**

A messaging feature can be added to allow direct communication between users and business owners for queries and job discussions.

- **Mobile Application**

Developing Android and iOS applications will make the platform more accessible and convenient for users.

- **Improved Security Features**

Advanced security like OTP verification and encrypted passwords can be implemented to protect user data.

- **Advanced Database System**

The system can be upgraded from SQLite to databases like MySQL or PostgreSQL for better performance and scalability.

9. References

The following references were used during the development of the Business Accelerator system. These sources provided guidance for backend development, database design, frontend design, and problem-solving.
